REPORT

TO

THE RIGHT HONOURABLE HENRY CHAPLIN, M.P.,

President of the Local Government Board, &c., &c.

(1897.)

SIR,

I HAVE the honour to submit to you the following Report on the estimated population, and on the marriages, births, and deaths registered in England and Wales during the year 1897.

POPULATION.

The population of England and Wales, as enumerated on 6th April, 1891, consisted of 29,002,525 persons. The natural increase by excess of births over deaths from the beginning of April 1891 to the middle of 1897 amounted to 2,263,322 ; and, if there had been neither emigration nor immigration, this would have raised the population to 31,265,847 at the latter date. In the absence of precise information regarding these disturbing causes, the populations in the annual Reports are provisionally estimated on the assumption that the rate of increase which had prevailed in the last completed intercensal period has since been maintained.

The census of London which was taken in March 1896, furnished the means of revising the estimates of the population of the

metropolis for the years 1891–96. Accordingly the populations for these years, which are shown in Table 1, and are used in the calculation of the rates of marriage, birth, and death for this Report, are estimated on the assumption that the rates of increase which had occurred (1) in London between 1891 and 1896, and (2) in the remainder of the country between 1881 and 1891, were maintained until the end of 1897. The population of England and Wales calculated in this way amounted, in the middle of the year 1897, to 31,055,355 persons, of whom 15,047,580 were males, and 16,007,775 were females.

MARRIAGES.

During the year 1897, 249,145 marriages were registered, corresponding to a rate of 16·0 persons married per 1000 of the estimated population. This is the highest marriage rate that has been recorded since the year 1876. In the 28 years 1849–76 the marriage rate had only once fallen below 16·0 per 1000, and had averaged 16·8; in the 20 years 1877–96 the rate had only once (in 1896) reached 15·8, and had averaged 15·1. Among registration counties the lowest marriage rates during 1897 were 12·2 in Middlesex, 12·3 in Rutlandshire, 12·6 in Oxfordshire, 12·9 in Herefordshire, and 13·0 in Westmorland; the highest rates were 17·3 in Nottinghamshire and in the East Riding of Yorkshire, 17·7 in Staffordshire, 18·5 in London, and 19·3 in Warwickshire. The five counties which are here quoted as representative of low marriage-rates in 1897 had also been included among the ten counties with lowest average rates in the ten years 1887–96; and the five counties which are quoted as representative of high marriage-rates in 1897 had also been included among the ten counties with highest average rates in 1887–96. Reference to Table 10 shows that the rise in the marriage-rate has been general throughout the country. In no less than 41 of the 45 registration counties the rate in 1897 was higher than the average during 1887–96. The four exceptions are Oxfordshire with a rate of 12·6 against an average of 12·8, Cornwall with a rate of 13·1 against an average of 13·3, Monmouthshire with a rate of 15·4 against an average of 15·9, and South Wales with a rate of 16·0 against an average of 16·2. The rise of the marriage-rate in 1896 had been accompanied by a rise in the value of British exports and in the value of imports, amounting to 6*s.* 0*d.* and 10*s.* 10*d.* respectively, per head of the population of the United Kingdom; by a rise of 3*s.* 1*d.* per quarter in the price of wheat; and by a slight fall, per head of the population, in the amount cleared at the London Bankers' Clearing House. The further rise of the marriage rate in 1897 was accompanied by a fall in the value of British exports amounting to 4*s.* 1*d.*, and a further rise in the value of imports, amounting to 2*s.* 7*d.* per head of the population of the United Kingdom; by a further rise of 4*s.* 0*d.* per quarter in the price of wheat; and by a further fall, per head of the population, in the amount cleared at the Bankers' Clearing House. (Table A.)

1897	16.0	5 17 7	11 6 6	18 14 3	30 2	241

* The figures in the marriage-rate column are not strictly comparable with those in columns 2, 3, and 4, inasmuch as the former relate only to England and Wales, whilst the latter relate to the whole of the United Kingdom. The figures relating to exports and imports and to the price of wheat, and those showing the amount cleared at the London Bankers' Clearing House, are derived from the Board of Trade Statistical Abstracts.

Forms of Marriage.—Of the 249,145 marriages in England and Wales during 1897, 170,806, or 686 per 1000, were solemnized according to the rites of the Established Church, and 78,339, or 314 per 1000, were contracted otherwise. These proportions are practically identical with the proportions in the preceding three years, as also is the distribution of the latter proportion among (a) marriages in registered buildings belonging respectively to Roman Catholics and other Christian denominations, (b) marriages of Quakers and of Jews, and (c) civil marriages. Among marriages according to the rites of the Established Church, marriages by licence and by Superintendent Registrar's Certificate show a further decrease, and marriages by banns a further increase. (Table 7.)

First Marriages; Re-marriages, &c.—Of the 249,145 men who married during the year 1897, 224,789, or 902 per 1000, were bachelors, and 24,356, or 98 per 1000, were widowers. Of the 249,145 women who married, 231,953, or 931 per 1000, were spinsters, and 17,192, or 69 per 1000, were widows. (Table 9.) Thus the decline in the proportion of re-marriages which has been noted in previous reports, has continued through the year 1897. The following figures show how steadily this decline has progressed since 1871-75 :—

	In 1000 Marriages.	
	Widowers.	Widows.
1871-75	138.2	100.2
1876-80	136.2	98.0
1881-85	126.0	89.2
1886-90	119.0	83.0
1891-95	112.8	79.2
1896	103	73
1897	98	69

Comparison of the actual figures for 1897 with those for 1896 shows that about 3 per cent. more bachelors and 3 per cent. more spinsters married in the later than in the earlier year, whilst the number of each sex who re-married was about 3 per cent. less in 1897 than in 1896.

Of the persons who married in the course of the year 1897, 311 are described in the marriage register as having been previously divorced.* This is the largest annual number of re-marriages of

* In Table 9, and on pp. 64-72, divorced persons are included among bachelors and spinsters.

divorced persons yet recorded. Table B shows the progressive increase in such marriages since 1861-65.

TABLE B.—ANNUAL NUMBERS OF DIVORCED PERSONS MARRIED, 1861-97.

	Divorced Persons Married.			Divorced Men and Spinsters.	Divorced Men and Widows.	Divorced Men and Divorced Women.	Divorced Women and Bachelors.	Divorced Women and Widowers.

1896	296	136	160	107	20	9	115	36
1897	311	142	169	114	21	7	129	33

Ages at Marriage.—The proportion of marriages of minors, which has shown a nearly unbroken decline since the year 1874, when it stood at 84 per 1000 among husbands and 227 per 1000 among wives, fell in 1897 to 51 per 1000 husbands and 170 per 1000 wives. A lower proportion of under age marriages has not been recorded for either sex since 1851. The decline in such marriages since 1871-75 will be seen from the following figures :—

				Marriages under Age in 1000 Marriages.	
				Husbands.	Wives.
1871-75	81'6	223'2
1876-80	77'8	217'0
1881-85	73'0	215'0
1886-90	63'2	200'2
1891-95	56'2	182'6
1896	53	174
1897	51	170

The registration counties which showed the highest proportions of husbands under age at marriage in 1897 were Northamptonshire, Bedfordshire, Staffordshire, Warwickshire, Leicestershire, and

Nottinghamshire ; the counties which showed the lowest proportions were Devonshire, Shropshire, Rutlandshire, Westmorland, and North Wales.

The registration counties which showed the highest proportions of wives under age in 1897 were Staffordshire, Leicestershire, Nottinghamshire, Derbyshire, the East Riding of Yorkshire, Durham, and Monmouthshire ; the counties which showed the lowest proportions were Devonshire, Herefordshire, Shropshire, Westmorland, and North Wales.

With few exceptions, those counties which showed high proportions or low proportions of minors of either sex among those who married in 1897, had also shown similarly high or low proportions in previous years. (Table 9.)

Among the 498,290 persons who married in 1897, all but 3835, or 1·5 per cent., of the husbands, and all but 4025, or 1·6 per cent., of the wives, made definite statements of age in the marriage register. In 1896 the corresponding proportions had been 1·7 per cent. of the husbands and 1·8 per cent. of the wives. Examination of the register shows that all but 12 of the minors who married in 1897 stated their ages in the register. Among adults, 98·4 per cent. of the husbands and 98·1 per cent. of the wives made definite statements of age, the remaining 1·6 per cent. and 1·9 per cent. respectively, being indefinitely described as "of full age." The proportions of unstated ages of adults were greater in the case of re-marriages than in that of first marriages, as is shown by the following figures :—

					In 100 Marriages of Adults.	
					Ages definitely stated.	Indefinitely described as "of full age."
Bachelors who married	Spinsters		98·8	1·2
"	"	"	Widows	...	97·4	2·6
Widowers	"	"	Spinsters	...	95·4	4·6
"	"	"	Widows	...	94·9	5·1
Spinsters	"	"	Bachelors	...	98·5	1·5
"	"	"	Widowers	...	95·1	4·9
Widows	"	"	Bachelors	...	97·0	3·0
"	"	"	Widowers	...	94·7	5·3

The mean age at marriage, and its changes from year to year, would become useful statistical data if they could be accurately calculated. All, however, that can be ascertained is the mean of the

recorded ages in any year ; there is no available means of ascertaining the difference between the mean of the recorded ages and the mean of all the ages. The difficulties which this subject presents were dealt with at some length in the Fifty-ninth Annual Report ; and an attempt was made to exhibit the relation between the varying proportions of unrecorded ages on the one hand, and the margin of error between the true mean age and the mean of the recorded ages on the other hand. Figures for 1897 have been worked out on the plan there described, and are shown in Table C ; the corresponding figures for 1896 having been added for convenience of comparison.

TABLE C.—MEAN AGES at MARRIAGE in 1896 and 1897.

In Marriages of		Mean Age if the recorded Ages are a true sample.				Addition to Mean Age for every 10 per cent. by which the unrecorded Ages of Adults exceed the recorded Ages.			
		1896.		1897.		1896.		1897.	
		Hus-bands.	Wives.	Hus-bands.	Wives.	Hus-bands.	Wives.	Hus-bands.	Wives.
Bachelors with Spinsters	..	Years. 26'30	Years. 24'54	Years. 26'35	Years. 24'59	Years. '035	Years. '036	Years. '030	Years. '031

In all Marriages of	Bachelors ..	26'59	24'96	26'63	25'00	'037	'039	'032	'033
	Widowers ..	44'49	37'11	44'53	37'05	'229	'197	'216	'186
	Spinsters ..	27'34	25'08	27'34	25'10	'046	'044	'041	'038
	Widows ..	42'34	40'58	42'36	40'74	'197	'198	'176	'177
In all Marriages		28'43	26'21	28'38	26'18	'057	'055	'050	'048

The mean age of bachelors who married, as given in the first and third columns of figures, shows an increase from 26'59 years in 1896 to 26'63 years in 1897 ; and the mean age of widowers shows an increase from 44'49 years in 1896 to 44'53 years in 1897. The age of all the men who married, however, decreased from 28'43 in 1896 to 28'38 in 1897. This apparent contradiction results from the change in the proportion of bachelors to widowers who married ; it merely expresses the fact that 902 bachelors and 98 widowers, at the respective mean ages recorded in 1897, have in the aggregate a mean age lower than that of 897 bachelors and 103 widowers at the respective mean ages recorded in 1896. It shows, however, the fallacy of using changes in the mean age at marriage of bachelors and widowers taken together as indicating any tendency to earlier or later marriage.

The mean age of spinsters who married, as given in the second and fourth columns of figures, shows an increase from 25'08 years

in 1896 to 25·10 years in 1897; and the mean age of widows shows an increase from 40·58 years in 1896 to 40·74 years in 1897. In consequence of the smaller proportion of widows among women who married in 1897 than in 1896, the age of all women who married decreased from 26·21 years in the earlier to 26·18 years in the later year. These figures are all based on the assumption that the recorded ages at marriage under the several headings are a true sample of all the ages. But it is not unreasonable to suppose that those adults who indefinitely describe themselves as "of full age" are on the average somewhat older than those who state their precise ages. The last four columns of Table C show the amount of error which is introduced by every 10 per cent. of excess in the unstated ages over the stated ages of adults. If those adult bachelors who do not state their ages are as much as 30 per cent. older than those who do, then the mean age of all the bachelors who married in 1896 was $26·59 + (.037 \times 3) = 26·70$ years, and the mean age of all who married in 1897 was $26·63 + (.032 \times 3) = 26·73$ nearly. The rise in the marriage age of bachelors between 1896 and 1897 would on this assumption be reduced from ·04 to ·03 of a year. The corrections in the cases of widowers and widows are on a larger scale, corresponding to the larger proportions who omit to state their ages. It may be hoped that in the course of a few years, the exact ages will be stated at all marriages, making it possible to follow with certainty any changes which may occur from year to year.

In the 59th Report it was pointed out that the age-constitution of those who marry is of greater statistical value than is the mean age, and Tables were given showing the age-constitution of bachelors, widowers, spinsters, and widows, who married in 1896 and in several previous years. Table D gives a comparison of the age-constitution of each of these classes in 1897 with that in 1896.

TABLE D.—AGE-CONSTITUTION of PERSONS who MARRIED in 1896 and 1897 reduced to 1000 at ALL AGES.

				Bachelors.		Widowers.		Spinsters.		Widows.

Signature in Marriage Register.—The marriage records for 1897 show a further decrease in the proportions of persons of both sexes who sign the register with marks. The proportion of illiterate men fell to 33 per 1000 marriages, and the proportion of illiterate women to 40 per 1000 marriages. In 10 per 1000 of the marriages, both bride and bridegroom signed with marks; in 23 the bridegroom only signed by mark; and in 30 the bride signed by mark and the bridegroom wrote his name. The following figures show the progressive decline in the proportions of illiterates since 1871:—

Years.	Signed by Mark in 1000 Marriages.		
	Husbands.	Wives.	Both.
1871-75... ..	185·4	251·8	104·2
1876-80... ..	148·0	199·8	74·6
1881-85... ..	123·4	154·8	54·4
1886-90... ..	84·0	98·2	30·2
1891-95... ..	51·2	59·6	16·6
1896	37	43	11
1897	33	40	10

The counties which in 1897 showed the highest proportions of illiteracy were: among men, Buckinghamshire, Hertfordshire, Suffolk, Cornwall, Shropshire, Staffordshire, Monmouthshire, and North Wales; and among women, Staffordshire, Lancashire, the West Riding of Yorkshire, Durham, Monmouthshire, South Wales, and North Wales. With hardly an exception, these are the counties which had also shown the highest proportions of illiteracy in the ten years 1887-96 (Table 10). It has been remarked in previous reports that in the southern counties there are more illiterates among the men than among the women who marry, whereas in the northern part of the country the women are the more illiterate. This peculiarity is again noticeable in the figures for 1897. Representing as before the southern part of the country by the registration divisions numbered I. to V., and the northern part by the divisions numbered VI. to XI., it is found that in all except one—viz., London—of the 22 southern counties more men than women signed by mark, and that in all except three—viz., Herefordshire, Shropshire, and Lincolnshire—of the 23 northern counties more women than men signed by mark. The illiteracy of both men and women is, however, greater in the

northern than in the southern counties, as is shown by the following figures :—

Year.	Illiterates in 1000 Marriages.			
	Southern Counties (Divisions I.—V.)		Northern Counties (Divisions VI.—XI.)	
	Men.	Women.	Men.	Women.
1895	35	32	44	59
1896	32	28	41	54
1897	30	27	35	49

Comparison of the three years shows that, although the proportion of men to women who sign by mark varies but little in either part of the country, the disparity between those parts was somewhat less in 1897 than it had been in 1895 and 1896.

Buildings registered for the Solemnization of Marriages.—At the end of the year 1897 there were 15,262 churches or chapels of the Established Church in which marriages can be solemnized, showing an increase of 33 upon the number at the end of 1896. There were also 11,998 buildings on the register for marriages by rites other than those of the Established Church, showing an increase of 282 upon the number on the register at the end of the previous year. (Table 6.)

Certified Places of Worship.—The number of buildings certified for religious worship in the course of 1897, and recorded in the official register under the provisions of the Acts 15 & 16 Vict. c. 36, and 18 & 19 Vict. c. 81, was 556; while 585 buildings were removed from the register on proof of disuse: the total number on the register at the end of the year 1897 was 23,404. A thorough revision of the register, which had been begun in 1894, was completed during 1897. The result of this revision has been to remove from the register, on account either of proved disuse or of unnecessary re-certification, the entries relating to between 6000 and 7000 out of the 28,939 chapels or buildings that appeared on the register when its revision was commenced.

BIRTHS.

The births registered during the year 1897 numbered 921,693, and were equal to a rate of 29·7 per thousand living. The birth-rate was identical with that in the year 1896, and this rate, with the single

exception of the rate in 1894, was the lowest on record; it was lower by 1.0 per 1000 than the average rate in the preceding ten years. The lowest county birth-rates were 22.6 in Westmorland, 23.2 in Sussex, 24.3 in Rutlandshire, 24.6 in Surrey, 24.7 in Oxfordshire, and 24.9 in Berkshire. The highest county rates were 32.5 in Northumberland, 32.6 in Warwickshire, 33.3 in South Wales, 34.1 in Monmouthshire, 34.6 in Staffordshire, and 35.2 in Durham.

Sex.—The births of males numbered 469,180, and the births of females 452,513. The births of males were to those of females as 1037 to 1000, the average proportion in the ten preceding years having been 1036 to 1000. In registration counties the lowest proportions of male to female births in 1897 were 923 in Westmorland, 989 in Rutlandshire, 997 in Oxfordshire, 999 in Cumberland, 1000 in Bedfordshire, and 1012 in Buckinghamshire. The highest proportions were 1066 in Shropshire, 1067 in Herefordshire, 1068 in Suffolk, 1069 in Somersetshire, 1070 in Berkshire, and 1103 in Huntingdonshire.

Illegitimate Births.—The infants registered as born out of wedlock in 1897 numbered 38,409; they were in the proportion of 42 per 1000 births, and corresponded with the proportion obtaining in each of the two years immediately preceding. In proportion to population, the illegitimate birth-rate was equal to 1.2 per 1000, and was the lowest on record. (Table 3). Among registration counties the lowest proportions of illegitimate to total births were 30 per 1000 in Middlesex, 31 in Essex, 32 in Monmouthshire and in South Wales, 33 in Warwickshire, and 36 in Somersetshire, Gloucestershire, and Durham. The highest proportions were 60 per 1000 in the North Riding of Yorkshire, 62 in Norfolk and in North Wales, 70 in Herefordshire, and 71 in Shropshire and in Cumberland. The six counties last mentioned had been among the counties with the highest average ratios of illegitimate to total births in the ten years 1887–1896. (Table 11.)

DEATHS.

The deaths registered during the year 1897 in England and Wales numbered 541,487, and were in the proportion of 17.4 per 1000 persons living, or 1.2 below the mean rate in the ten years immediately preceding. With the exceptions of the rates in 1894 and in 1896, the rate was considerably lower in 1897 than in any other year on record.

Among registration counties the lowest death-rates during 1897 were 13.3 in Surrey, 13.4 in Middlesex, 13.7 in Sussex, 13.9 in Buckinghamshire, 14.0 in Rutlandshire, and 14.1 in Westmorland. The highest county death-rates were 18.1 in the East Riding of Yorkshire and in South Wales, 18.2 in the West Riding of Yorkshire and in Northumberland, 19.5 in Staffordshire and in North Wales, 19.6 in London, 20.0 in Warwickshire, and 20.4 in Lancashire. (Table 11.)

Sex.—The 541,487 deaths registered in England and Wales included 280,211 of males and 261,276 of females. The death-rate among males was therefore equal to 18·6, and that among females to 16·3, per 1000 of each sex respectively. Compared with the average death-rates at all ages in the quinquennium 1891–5, the rate in 1897 among males fell 6 per cent., and that among females, 8 per cent. Out of equal numbers living, there were 1141 deaths of males to 1000 deaths of females, as compared with an average proportion of 1121 to 1000 in the ten years 1887–96. (Table 3.)

Ages.—Compared with the low rates of the immediately preceding year, the death-rates in 1897 among males showed an increase at all specified life periods, except at the two groups 5–10 and 10–15; and among females, an increase at all ages above the 45th year. (Tables 12–14.)

Infantile Mortality.—In the year 1897 the proportion of deaths of infants under one year of age to registered births was 156, and was therefore higher than the average rate in the preceding ten years by 8 per 1000. In registration counties, the mortality of infants under one year of age in 1000 births ranged from 101 in Hertfordshire and 109 in Buckinghamshire, in Suffolk, in Herefordshire, and in Rutlandshire, to 179 in Staffordshire and 187 both in Warwickshire and in Lancashire. (Table 11.)

The mortality of male infants was 170·3, while that of female infants was 140·8 per 1000 births of each sex respectively. In equal numbers born, the deaths of males to the deaths of females under one year of age were in the proportion of 121 to 100, which tallies very closely with the proportions in previous years. (59th Annual Report, p. xviii.)

Urban and Rural Mortality.—The variations in the death-rates during a series of years, in the groups of districts taken to represent the urban and rural areas respectively, are given at page cxv. The urban death-rate in 1897 was equal to 18·2 and the rural rate to 15·8 in each 1000 of the respective populations. The urban rate was below the average of the ten preceding years by 1·3 per 1000, and the rural rate was below the average by 1·2 per 1000. In the year 1897 the ratio of urban to rural mortality was as 115 is to 100, which agrees with the average ratio in the ten years immediately preceding. (Tables 29, 30.)

REGISTERED CAUSES OF DEATH.

In the year 1881 a new system of classification of causes of death, based on the second edition of the nomenclature of diseases issued by the Royal College of Physicians, was adopted in these Annual Reports. This change involved many important modifications; and in arranging the details of Tables 17 to 22 of the present Report the figures published in the Reports prior to 1881 have been corrected, and made for the most part comparable with the figures for

subsequent years. There still remain, however, a few instances in which no satisfactory adjustment is practicable for the years 1878-80. In order to explain, as fully as possible, the discrepancies between the old Tables and the new, the following expedient has been adopted. Every heading in Tables 17-22 which is affected by a change of classification is marked either with an asterisk or with a dagger, or with both. An asterisk denotes a change or changes in respect of which full correction has been carried out; a dagger denotes a change or changes in respect of which no correction, or only partial correction, has been practicable. All the headings thus affected appear in alphabetical order in a numbered list of diseases printed in the Fifty-seventh Annual Report (pp. lxxiv.-ix.). In this list changes of classification are indicated by means of reference numbers.

The deaths registered in 1897 and in the ten years immediately preceding, when distributed to the several "classes" by their assigned causes, were equivalent to the rates shown in the following table:—

TABLE E.—ANNUAL RATES OF MORTALITY from the SEVERAL CLASSES of DISEASES, per 1,000,000 PERSONS LIVING.

YEAR.	All Causes.	Zymotic Diseases.	Parasitic Diseases.	Dietetic Diseases.	Constitutional Diseases.	Developmental Diseases.	Local Diseases.	Violence.	Ill-defined and not specified Causes.
1887	19,074	2,702	30	64	3,213	1,578	9,867	652	968
1888	18,112	2,133	25	63	3,166	1,569	9,643	622	891
1889	18,221	2,456	24	67	3,223	1,550	9,394	614	893
1890	19,548	2,541	24	81	3,374	1,611	10,364	653	900
1891	20,217	2,706	23	83	3,339	1,690	10,807	670	899
1892	18,982	2,785	21	79	3,168	1,624	9,801	651	853
1893	19,170	3,165	20	88	3,210	1,593	9,536	675	883
1894	16,594	2,257	15	71	3,015	1,462	8,427	638	709
1895	18,727	2,822	17	79	3,160	1,678	9,433	680	849
1896	17,101	2,549	14	83	3,001	1,536	8,536	643	739
Mean 1887-96	18,575	2,612	21	76	3,188	1,589	9,581	650	858
1897	17,436	2,591	12	90	3,067	1,613	8,651	664	748
Deaths 1897 ..	541,487	80,469	393	2,792	95,284	50,093	268,791	20,608	23,057

Zymotic or Specific Febrile Diseases.—In the year 1897 the deaths attributed in the registers to this class of diseases numbered 80,469, or 14·9 per cent. of the deaths from all causes. These deaths were equal to a rate of 2591 per million, against an average rate of

2612 per million in the ten years immediately preceding. The rise in zymotic mortality during 1897, as compared with the mortality during the previous year, is due to a marked increase in the fatality of influenza and of diarrhœa. The other principal zymotics were less fatal in 1897 than they had been in the year immediately preceding. (Tables 17-22.)

Small-pox.—The deaths referred to small-pox in the year 1897 were 25 in number, and corresponded to a rate of less than 1 per million of the population, as compared with rates of 49, 27, 7, and 18 per million in the four preceding years respectively. The deaths from small-pox in 1897 were fewer in number than those registered in any year since 1890, and with the exception of that year and of the year 1889, were considerably fewer than in any other year on record. Of the 25 deaths registered, 16 were those of London residents, leaving only 9 in the rest of England and Wales; 6 of the deceased persons were returned as vaccinated, and 5 as not vaccinated, whilst with respect to the remaining 14, no satisfactory statement as to vaccination appeared in the certificates. In addition to the deaths definitely referred to small-pox, 103 were attributed to chicken-pox, and 36 to the effects of vaccination; so that, in the year 1897, the total number of deaths either certainly or possibly caused by variola, and of deaths alleged to have been caused by measures taken to prevent that disease, was 164, or 5 per million of the population.

The 36 deaths ascribed to "Effects of Vaccination" include not only the deaths that were directly referred to vaccination, but also those that were stated in the medical certificates, or were found on enquiry, to have been caused by the entrance of any noxious material whatever at the site of vaccination. The mortality from the effects of vaccination (defined as above) in proportion to children vaccinated cannot yet be given for the year 1897; but it appears from the "Digest of Vaccination Officers' Returns for the Year 1895," published in the Medical Officers' Supplement to the Twenty-seventh Annual Report of the Local Government Board, that the operation of vaccination was performed on 624,690 of the children who were born in that year, which is the latest for which such particulars have as yet been published. The number of deaths registered in 1895, under the heading "Effects of Vaccination," was 56, or one in every 11,155 vaccinated.

Measles.—The deaths from measles in the year 1897 numbered 12,711, and were equal to a rate of 409 per million living, which is lower by 43 per million than the average death-rate from this disease in the ten years 1887-96. The highest county death-rates from measles were 557 per million in Cheshire, 619 in South Wales, 630 in Cornwall, 668 in Warwickshire, 847 in Monmouthshire, and 935 in Lancashire. No death from measles was recorded during the year in Rutlandshire; the lowest county rates were 20 per million in Cambridgeshire and in Suffolk, 46 in Bedfordshire, 67 in Kent, 68 in Berkshire, and 77 in Leicestershire.

Scarlet Fever.—The deaths from scarlet fever in the year 1897 were 4577 in number, and corresponded to a death-rate of 147 per million. This is the lowest rate on record; it is considerably below the rate in the year 1896, and as compared with the average rate in the ten years immediately preceding, it is lower by 29 per cent. No death from this disease was recorded during the year in Westmorland, and the rate was below 50 per million in Sussex, Berkshire, Buckinghamshire, Oxfordshire, Cambridgeshire, and Devonshire. The highest county rates were 204 in Lancashire, 208 in Cheshire, 214 in Derbyshire, 224 in the West Riding of Yorkshire, 255 in Leicestershire, 259 in Staffordshire, and 271 in Northamptonshire.

Of 785 deaths from scarlet fever of London residents which, during 1897, were registered either in London or in the Metropolitan Asylum Hospitals situated outside London, 592, or 76 per cent., occurred in public institutions, as against 75, 69 and 68 per cent. respectively, during the three years immediately preceding.

Enteric (Typhoid) Fever.—4851 deaths from enteric fever were registered in England and Wales during 1897. These deaths were equal to a rate of 156 per million of the population, which, with the exception of the rate in 1892, is lower than the rate in any other year on record. The average death-rate from this disease in the ten years ending with 1896 was equal to 175 per million.

The eight counties with the highest death-rates from enteric fever in 1897 were:—Durham 190, Northumberland 196, West Riding of Yorkshire 202, Lancashire 214, East Riding of Yorkshire 217, Nottinghamshire 225, Kent 285, and Norfolk 297. The enteric fever rates in the first six of these counties had been in excess of the rate for the whole country, not only in the ten years 1887–96 taken as a whole, but also, with very few exceptions, in each of those ten years taken separately. On the other hand, the rate in Norfolk had risen above that for England and Wales only three times, and the rate in Kent not once, during the ten previous years. The high rates in these two counties during 1897 were caused by severe outbreaks, which were, however, confined to comparatively small areas. Out of 248 deaths from this disease in Kent, not fewer than 150 occurred in the district of Maidstone, corresponding to a mortality of one in every 333 of the population. In the remainder of the county the death-rate from enteric fever was only about 119 per million, or 37 per million below the rate for England and Wales. Out of 139 deaths in Norfolk, 34 occurred in Norwich and 18 in Great Yarmouth, corresponding to rates which were respectively rather less than double, and rather more than double the general English rate. A much more serious outbreak occurred in the small district of King's Lynn, where 52 deaths occurred among a population of about 19,000, the mortality from this cause alone being one in every 370. In the remainder of Norfolk, after deducting these three districts, the enteric fever rate was about 122 per million, or 34 per million below the rate for the whole country. It is noteworthy that the outbreaks of 1889, 1890, and 1892 (the three years referred to above as those in which enteric fever mortality in Norfolk had been excessive) affected the districts of Great Yarmouth and Norwich, while the outbreak of 1892 affected King's Lynn also.

It will be gathered from these remarks that the high mortality from enteric fever both in Kent and in Norfolk during 1897 probably resulted from temporary causes, although in the case of Norfolk such causes show a tendency to recur. It further appears that the special outbreaks in both counties have affected only small areas. A similar explanation is not available in regard to the six other counties which have been mentioned as showing excessive mortality from enteric fever in 1897. An exhaustive analysis of the local distribution of the disease in these six counties is impracticable for the present Report; the following summary, however, derived from a general survey of the mortality during a few recent years, will be useful.

In Nottinghamshire enteric fever appears to be endemic in the contiguous districts of Nottingham, Basford, and Mansfield. Of 124 deaths from this disease during 1897, 112 occurred in this group of three districts (which together contain about three-fourths of the population of the county). Outbreaks have also occurred occasionally, but less persistently, in Worksop and in Newark.

Year by year for a long period, the mortality from enteric fever has been higher in Lancashire than in England and Wales generally. It is difficult to trace the incidence of enteric fever among the registration districts of this county, inasmuch as hospital deaths are registered in the districts which contain these institutions, whilst hospitals belonging to some of the large towns receive patients from parts of those towns which extend into other registration districts. As far, however, as can be inferred from available statistics, it appears that nearly all of the 30 registration districts in Lancashire are subject either to constantly excessive incidence or to frequent outbreaks of enteric fever. The districts which are found to suffer least, or least frequently, are those of Oldham, Ormskirk, Warrington, Clitheroe, Garstang, Lunesdale, Ulverston, and Barrow-in-Furness.

The high mortality from enteric fever in the West Riding of Yorkshire as a whole during 1897 was mainly due to its prevalence within a continuous area formed by the cities of Sheffield and Leeds, together with the registration districts of Rotherham, Barnsley, Wakefield, and Dewsbury. The records of other recent years show that all the districts in this area have been specially liable to enteric fever. A smaller area in the West Riding, formed of the two registration districts of Keighley and Todmorden, experienced more than the average death-rate from enteric fever in 1897; this area had also suffered considerably in several previous years. The outbreak in the East Riding of Yorkshire was practically limited to two areas; namely, (1) the registration district of York, and (2) the districts of Hull and Sculcoates, which latter districts are together nearly coterminous with the municipal borough of Hull. Both these areas had suffered frequently and excessively from the disease in previous years.

Attention has been drawn in several recent Reports to the persistence of excessive mortality from enteric fever in nearly every district in the county of Durham, as well as in a few of the neighbouring districts in the North Riding of Yorkshire and in Northumberland. The mean death-rate from enteric fever during the seven years 1890-96, in this group of 19 districts, was not less than 329 per million, against 173 per million in the whole of England and Wales.

In only one of these districts, Newcastle-on-Tyne, was the rate in these seven years below the average for England and Wales, while in several of them it was enormously in excess, reaching 509 per million in Middlesbrough, 519 in Easington, 524 in Sunderland, and 561 in Houghton-le-Spring. In 1897 the mortality for the group as a whole was still in excess, but the excess was less marked than in any year since 1892. In six of the 19 districts, namely, in Guisborough, Darlington, Stockton, Hartlepool, Durham and Chester-le-Street, the rates were below the mean for England and Wales; whilst the highest rates were 300 in Tynemouth, 321 in Houghton-le-Spring, 325 in Castle Ward, and 423 in Sedgefield. A still higher rate had prevailed in Houghton-le-Spring in 1896, but Tynemouth, Castle Ward, and Sedgefield all showed an increase during 1897. With the exception of these three districts and of Newcastle-on-Tyne, however, all the districts in the group showed an improvement in 1897 as compared with 1896. The variations of prevalence in the several districts are shown in Table F.

TABLE F.—MORTALITY FROM ENTERIC FEVER.

* The Newcastle Hospital for Infectious Diseases is situated in Tynemouth district; for the purposes of this table, deaths of Newcastle residents in this institution from enteric fever have been transferred to Newcastle-on-Tyne district.

Diphtheria.—7654 deaths were referred to diphtheria during the year 1897, corresponding to a death-rate of 246 per million living. This is a lower rate than that of any of the four years last preceding, although it exceeded by 20 per million the average rate in the ten years 1887–96. The death-rate in the year under notice from diphtheria and croup together was equal to 281 per million, which is lower than in any previous year since 1891. The table on the opposite page shows the mortality in England and Wales registered as due to “diphtheria” and “croup” both separately and collectively, from the year 1859 to 1897. The ratio of deaths returned as from “croup” to those returned as from “diphtheria” was very inconstant during the earlier years dealt with in the table; but since the year 1882 the ratio has diminished steadily and not slowly from year to year.

In the year 1897 the mortality from diphtheria alone in 35 of the counties was lower than the general English rate. The ten counties with diphtheria rates in excess of the average were:—Gloucestershire, where the rate was 261 per million, Leicestershire 299, Shropshire 319, Essex 320, Staffordshire 334, South Wales 377, North Wales 388, Kent and Middlesex 411, and London 511. The diphtheria rate in these ten counties taken together was 417 per million, whilst in the remainder of England and Wales it did not exceed 153 per million.

Whooping-cough.—The deaths from whooping-cough numbered 11,431, and corresponded to a rate of 368 per million of the population, against an average rate of 417 in the ten years 1887–96. The highest county death-rates from whooping-cough were 424 per million in Leicestershire, 428 in Oxfordshire, 431 in South Wales, 471 in Staffordshire, 488 in Cheshire, 572 in Nottinghamshire, 576 in the North Riding of Yorkshire, and 682 in Northamptonshire.

Influenza.—The deaths in England and Wales referred to influenza in the year under notice numbered 6088, and corresponded to a death-rate of 196 per million. Although this rate was considerably higher than that of 1896, it was nevertheless below the rate in any other year since 1890. The increase in 1897 has been general throughout the country; in every county of England and Wales, except Buckinghamshire, Dorsetshire, and Westmorland, the death-rates from influenza showed an increase on those recorded in the year immediately preceding.

Diarrhæal Diseases (diarrhœa, dysentery, and cholera).—The deaths attributed to these causes in 1897 numbered 27,051, and were equal to a rate of 871 per million, which exceeded by as much as 38 per cent., or 240 per million living, the mean rate in the ten years ending with 1896. The death-rate from diarrhœal diseases was under 300 per million in Oxfordshire, Wiltshire, Dorsetshire, Herefordshire, Shropshire, and Westmorland. The highest county rates were 1075 per million in Middlesex, 1076 in the West Riding of Yorkshire, 1114 in Nottinghamshire, 1161 in Leicestershire, 1275 in Lancashire, 1359 in Staffordshire, 1523 in Warwickshire, and 1572 in the East Riding of Yorkshire.

TABLE G.—DIPHTHERIA and CROUP.—DEATHS per MILLION PERSONS LIVING,
1859-1897.

1896	292	51	343
1897	246	35	281

Hydrophobia was the certified cause of death, during the year, in six instances ; the numbers in the four years immediately preceding having been 4, 13, 20, and 8. Of the six deaths recorded during the year under notice, two occurred in Warwickshire, one in London, one in Herefordshire, one in Worcestershire, and one in Lancashire.

Puerperal fever caused 1836 deaths, and other accidents of childbirth 2414. Together, these deaths were in the proportion of 4·61 per thousand births. In the four years immediately preceding, the proportions had been 6·51, 5·36, 4·57, and 4·98.

Parasitic Diseases.—The deaths referred to the diseases thus grouped numbered 393, or 0·07 per cent. of the deaths from all causes ; this is the smallest number recorded in any year on record. Of the total deaths from parasitic diseases, 258 were ascribed to thrush, and the remainder to worms, hydatids, &c. (Tables 17–22.)

Dietetic Diseases.—The deaths referred to dietetic diseases numbered 2792, or 0·5 per cent. of the deaths from all causes. The mortality from dietetic diseases in 1897 was in the proportion of 90 per million of the population ; this rate is higher than that in any other year of the previous decennium, during which it averaged 76 per million. Among males the rate of mortality from these diseases was equal to 111 per million living, and among females to a rate of 70 per million. To intemperance there were directly attributed during the year 2397 deaths, viz., 1460 of males and 937 of females. The male death-rate from intemperance was 97, and the female rate 59 per million living of the respective sexes, both rates being the highest on record. (Tables 17–22.)

Constitutional Diseases.—The deaths during 1897 referred to constitutional diseases in the aggregate numbered 95,284, and were in the proportion of 17·6 per cent. of the total deaths, and of 3067 per million of the population ; the latter rate is slightly lower than the average in the preceding ten years, which was 3188 per million. (Tables 17–22.)

Cancer.—The deaths referred to cancer, or malignant disease, numbered 24,443, and were equal to a rate of 787 per million persons living of both sexes and at all ages. Among males the rate was equal to 636 per million living of that sex, and among females it was equal to 929 per million. Both the male and the female rates were higher in 1897 than in any previous year on record, and exceeded by 20·2 and by 10·6 per cent. respectively, the corresponding mean rates in the previous decennium.

It has been noticed in several previous reports* that, although the aggregate cancer mortality per million living is much greater among females than among males, nevertheless the increase in

* Cf. 47th Report, p. xviii, and 52nd Report, p. xiv.

later, as compared with earlier years, is proportionally greater among males than among females. For example, as between the decennia 1851-1860 and 1871-80, the increase in the mortality from cancer had been 62 per cent. among males and only 43 per cent. among females. The mortality of the sexes is thus seen to have increased by 62 per cent. and 43 per cent. respectively within a period of 20 years; and this is equivalent to an increase of 2.4 per cent. annually among males and an increase of 1.8 per cent. annually among females. The comparison may be continued to later years as follows:—In 1861-70 the mean annual mortality among males was 242 per million living, and among females 519 per million, but in 1891-97 the rates had risen to 571 and 882 per million respectively; the rate of increase was therefore equal to 136 per cent. among males and 70 per cent. among females. These amounts of increase may be taken in the same way as above to have occurred in a period of $28\frac{1}{2}$ years; they are equivalent to an increase of 3.1 per cent. annually among males, and an increase of 1.9 per cent. annually among females. Should equal percentages of increase be maintained in future years they would bring up the rates of cancer mortality to 1781 per million among both males and females about the year 1932, and thereafter the rate among males would exceed the rate among females.

In view of what is known as to the relative liability of the sexes to cancer, the hypothetical result just stated seems to justify the expectation that changes in the incidence of cancer mortality upon males and females respectively will be less rapid in the future than they have been in the past. It may be noted that the increase between 1851-60 and 1871-80 was the resultant of two factors, viz., (a) changes in the actual mortality from malignant disease, and (b) improvements in medical diagnosis. In the interval between 1861-70 and 1891-97, however, another factor was introduced by the system of enquiry which was established in 1887 respecting deaths indefinitely certified as due to "tumours." Of the deaths classed under the heading "cancer" in the seven years 1891-97, 2.6 per cent. are the result of this system. Probably the real proportion due to such enquiries is somewhat greater, for experience shows that medical practitioners, having come to appreciate more clearly the nature of the information required for purposes of classification, now fill up their certificates more carefully, and thus obviate the need for subsequent correspondence. Previous to the year 1897 the answers were not tabulated for males and females separately, but in that year the numbers relating to the two sexes were found to be almost exactly equal. If therefore it be assumed that in previous years equal numbers had been added to the cancer mortality of the two sexes, the rates in 1891-97, independently of the additions which have thus been made, would have been 551 per million for males and 863 per million for females. These rates correspond to an average annual increase of 2.9 per cent. among males and 1.8 per cent. among females, on the rates recorded in 1861-70. It is impossible to ascertain the exact proportion of the recent increase in cancer mortality that is justly attributable to improvement in medical diagnosis; but, whatever this may be, it is evident that as regards the future there are limits to any possible effects of such improvement.

Table H has been introduced to show the changes in the recorded mortality of males and females of various ages from cancer between the period 1861-70 and the period 1891-97.

TABLE H.—MEAN ANNUAL MORTALITY from CANCER, per MILLION LIVING of each SEX, at successive GROUPS of AGES, in 1861-70, and in 1891-97.

	Males.		Females.		Ratio.*

* *i.e.*, the ratio of mortality in 1891-97 to that in 1861-70, the latter taken as 100.

With respect to age, Table H shows (1) that the incidence of cancer is comparatively slight among persons below the age of twenty years, but that above that age, both men and women

experience a mortality from this malady which increases steadily and progressively up to the highest age. This appears to have been equally true of the mortality in 1861-70 and of that in 1891-97. The table further shows (2) that the rate of increase, as between the earlier period of years and the later, has been by no means uniform at the several stages of life. The relative increase at the earlier ages, being based on very small figures, may be disregarded, but among adults important differences are observable. Thus, among men aged 35-45 the rate of increase since 1861-1870 has been equal to 89 per cent., and among females to 37 per cent. only. At the succeeding age group the increase has been 139 and 52 per cent. respectively, and at the age group 65-75, 167 and 99 per cent. At ages above 75 years, however, the difference in the rates of increase has not exceeded 21 per cent.

Following the method usually adopted in these reports, the rates of cancer mortality in Table H have now been compared as regards their mutual proportions. These rates, however, admit of further comparison with respect to their arithmetical differences. Comparing the later period with the earlier, it is found that the mortality of males at all ages has increased by 329 per million living, and that of females by 363 per million living. The greater increase of mortality among females is due to the larger proportion of that sex who survive to the higher ages. Taking separately the age groups above 35 years, it is found that at ages 35-45 the mortality of males increased by 182, and that of females by 249 per million living; at 45-55 the increase was 747 among males and 798 among females; at 55-65 it was 1849 and 1754; at 65-75 it was 3115 and 2764; and at 75 years and upwards it was 3174 and 3349, respectively. The increase in the rate of cancer mortality at each age group has therefore been approximately equal among males and females.

It is often convenient to compare death-rates at different periods either by their differences or by their ratios; and, when such comparisons extend over varying periods, it becomes necessary to refer the changes to some unit of time, for example a year or a decennium. But such comparisons must be regarded as approximate only; since they necessarily depend on some implied relation between changes in death-rates and the length of time within which those changes occur. So long as this implied relation is confined to the period in which the change has occurred, approximate comparisons may safely be made; but there is danger of drawing false conclusions if the same relation be assumed to hold for any later period. One example of such danger has already been given by showing that the assumption of geometrical progression applied to cancer death-rates involved the conclusion that the rate for males would, within a few years, overtake and exceed the rate for females. It is further evident that a date might be calculated at which, on the same assumption, either of the rates would reach 1000 per 1000. The theory of change by arithmetical progression is open to the same objection—namely, that an increasing death-rate would eventually reach 1000 per 1000—and to

the further objection that a decreasing death-rate would eventually disappear.

It is important that it should be known that a large proportion of the certificates of death by malignant disease contain very imperfect information as to the exact form of disease which has been the cause of death. In private practice, and especially in cases where no autopsy takes place, it is of course difficult to be certain on this point. But, inasmuch as a large and perhaps an increasing proportion of the deaths from cancer occur in public institutions where the requisite investigations are commonly made, it would greatly conduce to more accurate classification in this office if definite information could be secured in a much larger share of the cases certified ; and this ought not to be impracticable. In the year under notice, out of a total of 24,443 deaths from malignant disease, 751 were returned as from scirrhus, 1268 from epithelioma, and 1485 from sarcoma, whilst not fewer than 20,939 were returned simply as from cancer or malignant disease. The figures in Table J give all the particulars derivable from the certificates, but there is no doubt that if the truth could be ascertained in every case the numbers in other columns would be increased at the expense of those in the first and sixth.

The table further gives the means of estimating the relative frequency with which malignant disease attacks various parts or organs of the body, among males and females respectively. It has already been shown that malignant disease in the aggregate is much more prevalent among women than among men, but the excess is largely due to the fact that the female generative and mammary organs are specially liable to invasion by this malady. If the deaths from diseases of the ovaries, uterus, and breast be subtracted from the total deaths of females from malignant disease, the remaining deaths will give a mortality for females considerably lower than the male rate. Thus, in the year 1897, the male deaths, less the deaths from cancer of the generative and mammary organs, gave a death-rate equal to 625 per million living, whilst the female death-rate, with the same limitations, did not exceed 551 per million. In addition to cancer of the generative and mammary organs, cancer of the liver, peritoneum, intestine, kidney, abdomen, and pelvis is more frequent among women than among men ; but men are much more liable to cancer of the larynx, trachea, and lungs, of the mouth, tongue, throat, and œsophagus, as well as of the jaw, face, lip, and neck, and of the bladder, urethra, &c., than are women.

Tubercular Disease.—Of the 95,284 deaths from the entire class of constitutional diseases registered in the year under notice, not fewer than 59,941, or 1930 per million living, were referred to tuberculosis in one or other of its forms. In Table K will be found the rates of mortality from tuberculosis for each sex, at all ages, and at several groups of ages, in the year 1897, and for comparison with these are given the mean annual rates in groups of years.

MORTALITY PER MILLION BIRTHS.								
Under 1 year.	10,598	9,046	8,447	7,203	15	15	8,280	6,541

From this table it will be seen that the aggregate mortality from tuberculosis in 1897 was equal to a rate of 2184 per million living for males, and of 1692 per million for females. Comparing the mean rates of death in the last seven years with the corresponding figures in the ten years 1861-70, it appears that a very considerable decrease has occurred in the later period at every age group of both sexes, the decrease being greatest among females, and amounting at the age group 20-25 years to as much as 54 per cent.

In the course of the year 1897, the deaths from *Pulmonary Phthisis* numbered 41,642, and were equal to a rate of 1341 per million persons living of both sexes. This is the lowest rate on record, with the exception of the rate in the immediately preceding year, which did not exceed 1307 per million. The following table shows the rates of male and female mortality from phthisis at several ages in 1897 and also the mean rates in recent and in earlier groups of years.

TABLE L.—PHTHISIS.

MORTALITY per MILLION LIVING.

MORTALITY PER MILLION BIRTHS.								
Under 1 year.	1,437	647	1,299	550	55	58	607	429

Comparing the seven years which have elapsed since the last census with the ten years ending with 1870, we find that among persons at all ages, and of both sexes, the mortality from phthisis has decreased very considerably; but that among females the decrease has been much greater than among males. Among the former the aggregate mortality from phthisis in 1891-97 was scarcely more than half of what it had been in 1861-70. Among the latter the decrease amounted to rather more than one-third.

The table further shows that it is in the earlier stages of life, more especially, that the reduction has taken place. For example, among males the reduction at the several age groups from infancy to the 25th year has ranged between 49 and 60 per cent., and among females, from infancy to the 35th year, it has ranged from 49 to 58 per cent. At ages beyond the 35th year the reduction in mortality from this disease has been less, but it has been much greater among females than among males, the difference being observable even up to the higher ages.

The changes in the incidence of phthisis on the two sexes at the several age groups are remarkable. In 1861-70 the mortality from this disease was higher among females than among males at all age groups between 5 years and 35 years; the

mortality of males being the greater at ages under 5 and over 35. In 1891-97, the period of life during which females were more liable than males to die of phthisis extended only from age 5 to age 20, the mortality of males being the greater at ages under 5 and at all age groups over 20.

Table M. shows the average mortality from phthisis in England and Wales, and in each county, during the seven years, 1891-97. In this period both sexes experienced a higher rate of mortality from phthisis in London than in any other county; and as compared with the average rates in the provinces (*i.e.*, England and Wales, less London), phthisis mortality was excessive in the counties of Hampshire, Devonshire, Lancashire, the West Riding of Yorkshire, and Northumberland, and also in North and South Wales. Of the eight counties which experienced phthisis mortality in excess of the average among males as well as females in 1891-97, London, Lancashire, the West Riding of Yorkshire, Northumberland, and North and South Wales had also experienced a similarly excessive mortality in each of the decennial periods ending with the years 1880 and 1890 respectively. It further appears from the Table that among males only there was an excessive phthisis rate in Sussex, Cornwall, and Warwickshire, and among females only in Suffolk, Lincolnshire, Cheshire, Durham, and Cumberland.

The variations in liability to phthisis of the two sexes at different ages are well brought out by this table. Taking all ages under 15 years in one group, it is found that phthisis mortality is greater among females than among males in every registration county except three; the three exceptions being Middlesex and Herefordshire, in each of which the male and female rates are equal, and Huntingdonshire, in which the male rate exceeds the female rate. At the two age-groups 45-65, and 65 and upwards, the death-rates of males exceed those of females in every county. Of the two intermediate age-groups, the group from 15 to 25 years of age shows excess of *female* mortality in all except nine, and the group from 25 to 45 years of age shows excess of *male* mortality in all except eight, of the registration counties. These exceptions are of sufficient importance to call for special notice.

At the age-group 15-25 the mortality of females from phthisis is, as has just been pointed out, generally higher than that of males; the nine counties in which the reverse obtains are London, Surrey, Sussex, Hampshire, Middlesex, Worcestershire, Warwickshire, Leicestershire, and Rutlandshire. Further, in all these counties, except Hampshire, the female phthisis rates at ages 15-25 are below the general average; and the Census Report shows that the population of each of these counties, except Hampshire and Rutlandshire, contains a greater excess of females over males at the same age-group than does the English population generally. There would appear to be two possible explanations of this general coincidence between an unusual excess of women over men at ages 15-25 in the population, and a low rate of phthisis among those women. In the first place, the additional women may, on the average, be specially free from phthisis; in the second place, many who become affected with phthisis may remove to other counties to die. There are, however, no present means of ascertaining the extent to which either of these factors influences the result.

At the age-group 25-45, on the other hand, the mortality from phthisis is generally greater among males than it is among females; the eight exceptions to this rule are Dorsetshire, Rutlandshire, Lincolnshire, the North Riding of Yorkshire, Durham, Cumberland, Monmouthshire, and South Wales. In these eight counties the male rates are much below the general average; in four of them the female rates also are below the average, in two these rates slightly exceed the average, and in two others (Durham and South Wales) they are very excessive. The population of each of these eight counties except Dorsetshire contains relatively fewer females at the same age-group than does the English population generally. The relation between sex proportion in the population, and sex incidence of phthisis, is, therefore, the converse of the relation already noted at the previous age-group.

The foregoing deductions concerning the age-groups 15-25 and 25-45 may be summarized as follows:—Phthisis is generally more fatal to women than to men at the age-group 15-25; exceptions to this rule are almost invariably associated with high proportions of women in the population at that age-group. At ages 25-45 phthisis is generally less fatal to women than to men; exceptions are almost invariably associated with low proportions of women in the population at that age-group.

On further studying Table M., it will be noticed that although phthisis mortality at all ages, both among males and among females, is higher in London than the average in the extra-metropolitan portion of England and Wales, nevertheless, females of from 15 to 25 years of age die from this malady much less rapidly in London than they do in the provinces. On examining the records of earlier years it is found that this phenomenon is by no means new. It has, therefore, been deemed advisable to examine the subject more in detail. Accordingly the rates of mortality from phthisis in London and in the provinces (*i.e.*, England and Wales, less London), have been extracted for the last three decennia, at four groups of ages, and the figures for 1891-97 have been calculated for purposes of comparison. The result is shown in the appended table.

TABLE N.—PHTHISIS.

Taking females first, it appears from this table that throughout the four age-groups, from 10 years to 35, the phthisis mortality of young women in London is below that in the provinces, and that this is especially the case at ages from 15 to 25 years. The excess in the fatality of phthisis in the provinces, as compared with London, is becoming less as time goes on; thus, in the ten years 1861-70, the phthisis mortality among girls in London from ten to fifteen years old was less than that of girls in the provinces of the same ages by 26 per cent., whilst in the seven years ending with 1897 the difference was only 22 per cent. At ages 15 to 20 years the differences were respectively 41 and 31 per cent., and at ages 20 to 25 years they were 37 and 31 per cent. respectively. But further, the table shows that the disparity referred to is not confined to the female sex; for, although in a less degree, the same peculiarity is found to attach to young males in London, who die from phthisis less rapidly than do the same class in the provinces. If, therefore, the death-rates are to be trusted, it would seem that for some cause hitherto unexplained, young people of both sexes (although in different degree) die of phthisis in the extra-metropolitan portion of England and Wales much more rapidly than they do in London.

The deaths in 1897 referred to *Tabes Mesenterica* numbered 6255, and were equal to a rate of 201 per million, viz., 223 for males and 181 for females. The subjoined table shows the mortality from this disease at certain age-groups in recent and in earlier years.

TABLE O. — TABES MESENTERICA.

MORTALITY PER MILLION BIRTHS.								
Under 1 year.	4,112	4,278	3,474	3,454	+ 4	- 1	3,900	3,112

It appears from this table that *tabes mesenterica* is mainly fatal to young children, for the registered mortality from this disease at ages after the 15th year is relatively insignificant. Accordingly, in this table, no attempt has been made to show separately the

mortality at the several age groups above 15 years. Among children up to 10 years of age, this disease is much more fatal to males than to females. At ages under one year, when the mortality from *tabes mesenterica* is the highest, male infants died in the year 1897 at the rate of 3900 per million births, and female infants at the rate of 3112 per million: these figures, however, show some decrease as compared with the mortality prevailing in recent previous years. The mortality from this disease in 1897 among male children at ages below five years was equal to 1438 per million living, and among female children of the same ages, to 1122 per million. The table further shows that, comparing the periods 1891-97 and 1861-70, there has been, with one slight exception,* a decrease in the later period at all ages under 15 years, and an increase among persons above that age. The actual increase per cent. is shown for the several age groups in the table.

The deaths referred to *Tubercular Meningitis* in England and Wales during 1897 numbered 6606, and corresponded to a death-rate of 213 per million persons living, viz., 234 per million for males, and 193 per million for females. The appended table gives the rates of mortality from this disease at several age-groups in 1897, and also the mean rates in two groups of years.

TABLE P.—TUBERCULAR MENINGITIS.
MORTALITY per MILLION LIVING.

Age Groups.	Males.		Females.		Difference per cent. in 1891-97.		Mortality in 1897.	
	1861-70.	1891-97.	1861-70.	1891-97.	Males.	Females.	Males.	Females.

10—	93	111	85	119	+ 19	+ 40	109	116
Above 15 years.	7	26	7	24	+ 271*	+ 243*	27	24
MORTALITY per MILLION BIRTHS.								
Under 1 year.	4,239	2,446	2,974	1,795	- 42	- 40	2,293	1,812

* On reference to the previous columns it will be seen that these two percentages are based on very small rates, and are therefore of but little importance.

This table (like the table for *tabes mesenterica*) shows that the main incidence of mortality from tubercular meningitis is upon children under 15 years of age. Beyond that period the rates at

* Among male infants under one year of age, exceptionally, the mortality has increased since 1861-70 by four per cent.

separate age groups are too small to be worth recording. It is, however, worthy of note, that at ages above 10 years the rates of mortality from this disease in both sexes were considerably higher in 1891-97 than they had been in 1861-70. At ages under five years there has been a decrease in the later period as compared with the former, among male children as well as female.

Diabetes accounted for 2426 deaths in the year under notice; these deaths corresponding to a rate of 78 per million living, which is the highest rate on record, and is higher by 16 per cent. than the mean rate in the ten previous years. The mortality from diabetes among males was equal to 87 per million, and among females to a rate of 70 per million, these rates being respectively 11 per cent. and 23 per cent. in excess of the average rates. (Tables 17-22.)

Developmental Diseases.—During the year 1897 there were referred to developmental diseases 50,093 deaths, a number equal to 9·3 per cent. of the deaths from all causes, and to 1613 per million of the population. Of these 50,093 deaths, old age was returned as the cause in 28,618 instances. The deaths thus returned corresponded to a rate of 921 per million living; the rate was equal to 815 per million among males and 1022 per million among females. To premature birth, 17,779 deaths were referred, a number equal to 19·29 per thousand children born, which is the highest proportion on record. The mortality ascribed to congenital defects was equal to 4·01 per thousand births, against an average of 3·71 per thousand in the preceding ten years.* (Tables 17-22.)

Local Diseases.—The deaths in the year 1897 from local diseases numbered 268,791: they were equal to 49·7 per cent. of the deaths from all causes, and to 8651 per million persons living—a reduction of 930 per million as compared with the mean rate in the preceding ten years. To diseases of the nervous system (exclusive of convulsions) 46,361 deaths were referred; these deaths were equal to a rate of 1491 per million persons living. The male rate was 1547 per million, or 9·5 per cent. below the decennial average; the female rate was 1442 per million, or 9·6 per cent. below the average. To diseases of the circulatory system there were attributed 50,243 deaths, or 1617 per million persons living, against an average in the preceding decennium of 1674 per million. The mortality among males from circulatory diseases was 1615 per million, or 1·8 per cent. below the average, and among females it was 1620 per million, or 4·8 per cent. below the average. The deaths from diseases of the respiratory system, inclusive of croup, numbered 91,738, and were equal to a rate of 2953 per million persons living. Among males the rate was equal to 3274, and among females to 2654 per million; these rates being respectively lower than the rates in any previous year in the tables. In the

* See Table M. in Fifty-ninth Report, page xxvii.

CERTIFICATION OF CAUSE OF DEATH.

Of the 541,487 deaths recorded during the year, 43,728, or 8.08 per cent., were referred to coroners, who held inquests on 33,869, or 6.25 of the total deaths; of the other 9,859 deaths, about one-seventh part were recorded on the certificates of registered medical practitioners, while the causes of the remaining six-sevenths were uncertified. The number of uncertified deaths during the year was 11,103, of which more than three-fourths were reported to coroners, who decided that inquests were unnecessary. Of the total deaths during the year, 2.06 per cent. were uncertified, including 1.57 per cent. which were, and 0.49 per cent. which were not, reported to coroners. The following figures show the yearly changes with respect to death certification that have occurred from 1888 to 1897 :—

—	PROPORTIONS IN 100 DEATHS REGISTERED.		
	Certified by Registered Medical Practitioners.	Inquests.	Uncertified.
1888	91.33	5.59	3.08
1889	91.48	5.61	2.91
1890	91.54	5.62	2.84
1891	91.73	5.52	2.75
1892	91.60	5.70	2.70
1893	91.72	5.76	2.52
1894	91.19	6.30	2.51
1895	91.68	6.00	2.32
1896	91.53	6.26	2.21
1897	91.69	6.25	2.06

The proportions of uncertified deaths, as well as of deaths on which inquests are held, vary widely in different parts of the country. Table R. presents an analysis of the deaths under these headings, with additional information as to deaths referred to coroners, in each registration county during 1897. For the purposes of this table, London has been divided into two parts. The reason for this division is twofold: in the first place, the proportion of inquest cases to total deaths is much larger, and the proportion

TABLE R.—DEATHS REGISTERED during 1897, CLASSIFIED in respect of CERTIFICATION and NOTIFICATION to CORONERS. PROPORTIONS per 100 DEATHS in each REGISTRATION COUNTY.

North Wales	6'59	3'83	0'37	2'39	1'95	4'34	91'83	

of uncertified deaths is much smaller, in the Metropolitan districts north of the Thames than in the remainder of London; and in the second place, inquests are held on a much larger proportion of the cases which are reported to the coroners in the former than in the latter area.

As between different counties, the range of variation in the proportion of inquest cases and in that of uncertified deaths is comparatively greater than in that of certified deaths. For example, among the 46 counties (London being reckoned for this purpose as two) no less than 34 show proportions of certified deaths ranging between 91 and $92\frac{1}{2}$, the lowest proportion among the other 12 counties being $89\cdot34$ per cent. in North London, and the highest $93\cdot23$ in Middlesex. The proportions of inquest cases range between 5 per cent. and $6\frac{1}{2}$ per cent. in 30 counties, the lowest proportion among the other 16 counties being $3\cdot83$ in North Wales, and the highest $10\cdot53$ in North London. The proportions of uncertified deaths range between $1\frac{1}{2}$ per cent. and 3 per cent. in 24 counties, the lowest proportion among the other 22 counties being $0\cdot13$ per cent. in North London, and the highest $4\cdot64$ in Westmorland. Closer examination of the figures shows that there were 11 counties, namely, Kent, Berkshire, Huntingdonshire, Essex, Dorsetshire, Herefordshire, Shropshire, Warwickshire, Derbyshire, Westmorland, and North Wales, in which more than 3 per cent. of the deaths were uncertified. In all these 11 counties the proportions of inquest cases, both to total deaths and to deaths reported to the coroners, were below the respective averages for the whole country; and in all but four (Berkshire, Huntingdonshire, Shropshire, and North Wales) exceptionally large proportions of the uncertified deaths were registered by direction of coroners. The column in the table which shows the proportions of deaths registered as uncertified without notification to coroners deserves special notice. In Rutlandshire every uncertified death was reported to the coroner; among the other counties, the proportion of deaths which were neither certified nor reported to coroners ranged from $0\cdot01$ per cent. in Kent, $0\cdot02$ per cent. in North London, and $0\cdot08$ per cent. in Surrey, to $1\cdot25$ per cent. in the North Riding of Yorkshire, $1\cdot27$ per cent. in Durham, $1\cdot32$ per cent. in Bedfordshire, $1\cdot95$ per cent. in North Wales, and $2\cdot23$ per cent. in South Wales.

In Table S. the 33,869 inquest cases are classified according to sex, age, and assigned cause of death. The number of inquests on males exceeded the number on females at every age group, the greatest excess being at ages between 15 and 65 years, a period of life when men are specially liable to fatal accidents.

A similar table (Table T.) relating to uncertified deaths has been prepared. This table presents the same general features as those which have been previously noted in dealing with the ages and assigned causes of uncertified deaths. As regards age, uncertified deaths were again most numerous in proportion to total deaths among infants under 3 months; they diminished steadily until they reached a minimum at ages 15-25, and then slowly increased at

65 and upwards	93'34	1'91	4'75	95'42	1'69	2'89

The changes in the proportions of uncertified deaths from age group to age group have already been noted. Inquests were held in 1897 on rather more than 5 per cent. of the total deaths of infants under 3 months old, and on about $3\frac{1}{2}$ per cent. of the deaths at ages between 3 months and one year. After that age inquest cases increased rapidly among males, reaching a maximum of 16'33 of the total deaths at ages 15–25; declining slowly in the next two age groups, and falling a little below 5 per cent. at ages over 65 years. Among females the maximum proportion was 7'30 per cent. at ages 5–15; in the next three age groups the proportion ranged between 5 and 6 per cent., and at ages over 65 years it fell a little below 3 per cent. At ages under one year, the proportion of certified deaths was slightly greater among males than among females, but at all later age groups the greater proportion was among females. The difference is most marked at ages 15–25, when the proportion of inquests to deaths of males is at a maximum. At ages over 65 years the causes of 93'34 per cent. of deaths of men, and 95'42 per cent. of deaths of women were certified by registered medical men.

In about 60 per cent. of the inquest cases, verdicts of death by violence were returned; in the remaining 40 per cent. the causes of death were not on the whole so definitely specified as is requisite for purposes of statistical classification. For example, out of 14,630

"natural" deaths on which inquests were held, 1,423 were returned as due to convulsions, and 919 as due to syncope, without reference to cause in either case; while the causes of 1,360 were so returned that they could only be classed as "unspecified."

In the 44th Annual Report, the subject of coroners' inquests in relation to certification of cause of death was dealt with as follows:—

"One class of cases there is where at any rate it might be expected that full information would be forthcoming, namely, those cases in which a special inquiry is held at the public expense, in order to ascertain the cause of death. Unfortunately, however, many coroners appear to think that the exclusive object of an inquest is to ascertain whether a crime has been committed, and ignore altogether the other purposes, scientific and medical, to which inquests are intended to be subservient. Such vague findings as 'natural causes,' 'died by visitation of God,' 'sudden death,' and the like, may possibly satisfy the requirements of criminal law, but are utterly inadequate for all other purposes, and cannot be considered as really fulfilling the requirement of the Act, that the coroner shall state in his certificate what was the cause of death."* Since this was written, the phrase "visitation of God" has become nearly obsolete in the verdicts of juries, and the use of other vague terms has somewhat diminished; but enough has been said here to show that the opportunities which inquests afford of ascertaining the true cause of death are as yet less perfectly utilized than it is desirable that they should be.

OFFENCES AGAINST THE REGISTRATION ACTS.

In 1897, 23 persons, on prosecution by order of the Registrar-General, were convicted of different offences against the Registration Acts, as under:—

For giving false information for registration ...	12
For failing to comply with requisition to register a birth	1
For making and giving a false certificate of cause of death	2
For burying as stillborn without authority ...	3
For procuring to be buried as stillborn the body of a deceased child	1
For failing to give notice to the registrar of a burial without coroner's order, or registrar's certificate	2
For not delivering to the registrar a medical certificate of cause of death	1
For neglecting to furnish quarterly returns of marriages, &c. from a church	1

* 44th Annual Report, p. xxi.

PROGRESS OF REGISTRATION.

The names in the alphabetical indexes of births, deaths, and marriages recorded in the national registers of England and Wales were increased in the year 1897 by 1,961,470, this addition raising the aggregate number of names in the indexes, which at the end of 1897 embraced a period of 60½ years, to 94,732,223.

SEARCHES AND CERTIFICATES.

Besides the certified copies of the registers of births, deaths, and marriages kept in England and Wales pursuant to the Registration Acts of 1836 and 1874, a large number of other registers and records are deposited in the custody of the Registrar-General under statutory and other arrangements. A list of all these various registers and records will be found on pages xxix-xxxii of the Fifty-eighth Report. Searches may be made in any of these registers and certificates obtained of entries found, on payment of the prescribed fees.

During the 52 weeks ending 31st December 1897 the total number of searches was 58,664, and certificates were issued to the number of 37,485; the total amount received in fees for searches and certificates was 7,686*l.* 8*s.* 6*d.*

The following figures indicate that as time progresses the records in this Office are being utilised by the public more and more extensively for legal evidence of births, deaths, and marriages.

Years.	Total Searches.	Certificates Issued.	Amount Received.
1866 (complete year) ...	12,135	10,017	£ s. d. 1,860 15 6
1875 (52 weeks) ...	26,356	20,282	3,879 15 6
1885 (52 weeks) ...	36,450	27,682	5,317 13 6
1895 (52 weeks) ...	53,289	35,727	7,200 12 6
1896 (53 weeks) ...	57,444	37,435	7,600 0 6
1897 (52 weeks) ...	58,664	37,485	7,686 8 6

MORTALITY IN THE ARMY.*

The average strength of the Army at home and abroad in 1897 was 219,283, and the deaths during this year were 2,188, the rate of mortality thus being 10·0 per 1000, against 8·3 and 8·4 in the

* Based upon returns furnished by the Commander-in-Chief.

preceding two years. The mortality in the Army abroad was 15·2 per 1000, against an average of 12·4 per 1000 in the three years 1894-96; while that in the Army at home was 3·9 per 1000, against an average of 4·3 in the same three years. (Table 34.)

MORTALITY IN THE NAVY.*

The average force afloat was 80,540. The deaths during the year numbered 422, being in the proportion of 5·23 per 1000 of the strength. Of the 422 deaths, 305 were due to disease and 117 to violence; the death-rate from disease was therefore 3·78 per 1000, and that from violence 1·45 per 1000. Of the 117 deaths from violence, 109 were accidental and 8 were suicidal; the 109 accidental deaths include 45 from drowning and 11 from heat-stroke.

BIRTHS AND DEATHS OF BRITISH SUBJECTS AT SEA.

Marine Register Book.—In accordance with the Births and Deaths Registration Act of 1874 and the Merchant Shipping Act of 1894, Commanding Officers of Ships trading to or from British Ports are required, under penalty, to transmit returns of all births and deaths occurring on board their ships to the Registrar-General of Shipping and Seamen, who furnishes certified copies of such returns to the Registrars-General of England, Scotland, and Ireland. Similar returns are furnished by persons having charge of Her Majesty's Ships directly to the Registrars-General of Births and Deaths. These returns of births and deaths at sea constitute the "Marine Register Book." During the year 1897, this book was increased by the addition of 171 entries of birth and 2,724 entries of death.

Mercantile Marine.—The Registrar-General of Shipping and Seamen reports that the number of masters and seamen afloat during the year 1897, in vessels belonging to the Mercantile Marine of the United Kingdom (including the islands in the British seas) and registered under the Merchant Shipping Acts, was 233,780, being 2,044 more than in the preceding year. The reported deaths numbered 2,730, showing a rate of 11·7 per 1000 of the strength. This rate was 2·1 per 1000 below the mean rate in the five years 1892-96. (Table 36.)

Among *passengers* on board merchant vessels at sea 50 births and 326 deaths were reported in 1897; the births were 9, and the deaths 138, below the numbers reported in the preceding year. (Table 37.)

* From the Statistical Report of the Health of the Navy for the year 1897.

INTERNATIONAL VITAL STATISTICS.

In Tables 44-61 will be found international statistics concerning the marriages, births, and deaths in most of the European States. In every one of eleven countries from which returns for the year 1897 have been received, the birth-rate was below the average of the previous 26 years; and in only one of those countries did the birth-rate in 1897 exceed that of the previous year. The death-rates during 1897 in all the eleven countries were considerably below the respective averages. In six of these countries, namely, Austria, Hungary, the Netherlands, Belgium, France, and Italy, the rates were lower during 1897 than during any previous year shown in the tables; in three countries, namely, Denmark, the German Empire, and Prussia, the rate in 1897 was higher than that in 1896, but lower than the rate in any previous year; in Switzerland the rates in 1896 and 1897 were equal, and were lower than any in any previous year on record; and in Norway the rate in 1897 was higher than that in 1896, but, with one exception, lower than the rate in any previous year. Speaking generally, both birth-rates and death-rates have decreased throughout Europe in recent years, but the fall in the death-rates has been greater than the fall in the birth-rates.

I have the honour to be,

Sir,

Your faithful Servant,

BRYDGES P. HENNIKER,

Registrar-General.

General Register Office, Somerset House,

10th December, 1898.

REMARKS ON THE METEOROLOGY OF THE YEAR 1897.

BY JAMES GLAISHER, ESQ., F.R.S., &c.

The following remarks, both with regard to atmospheric pressure and temperature, are based on observations made near London, but they may be taken as having a general application :—

Atmospheric Pressure.—The readings of the barometer were above their averages from January 1st to the 5th, the mean daily excess being 0·30 in. ; from January 6th to the 13th it was below, the mean daily deficiency being 0·19 in. ; from January 14th to the 20th it was above, the mean daily excess being 0·16 in. ; from January 21st to February 6th it was below its average, being particularly so on January 22nd and 30th, and February 1st, 2nd, and 5th, when it was as much as 0·51 in., 0·68 in., 0·60 in., 0·63 in., and 0·57 in. respectively below ; the mean daily deficiency for the 17 days ending February 6th being 0·28 in. ; from February 7th to the 27th it was above, being as much as 0·63 in., 0·59 in., 0·61 in., and 0·53 in. above on February 16th, 22nd, 23rd, and 24th respectively ; the mean daily excess for the 21 days ending February 27th was 0·30 in. ; from February 28th to April 7th it was generally below, being particularly so on March 3rd, 5th, 14th, 15th, 16th, 17th, 28th, and 31st, and April 1st, the mean daily deficiency for these 9 days being 0·70 in., and the mean daily deficiency for the 39 days ending April 7th was 0·31 in. ; from April 8th to the 11th it was above, the mean daily excess being 0·17 in. ; from April 12th to May 3rd it was generally below, the mean daily deficiency being 0·03 in. ; from May 4th to the 21st it was generally above, the mean daily excess being 0·21 in. ; from May 22nd to the 30th it was below, being as much as 0·56 in. below on both May 27th and 28th, the mean daily deficiency being 0·25 in. ; from May 31st to June 15th it was generally above, the mean daily excess being 0·12 in. ; from June 16th to the 20th it was generally below, the mean daily deficiency being 0·15 in. ; from June 21st to July 4th it was generally above, the mean daily excess being 0·05 in. ; from July 5th to the 8th it was below, the mean daily deficiency being 0·12 in. ; from July 9th to August 4th it was generally above, the mean daily excess being 0·09 in. ; from August 5th to September 9th it was generally below, the mean daily deficiency being 0·18 in. ; from September 10th to the 16th it was above, the mean daily excess being 0·29 in. ; from September 17th to the 24th it was below, the mean daily deficiency being 0·19 in. ; from September 25th to November 11th it was generally above, being particularly so on October 4th, 5th, 6th, 7th, 20th, 21st, and 22nd, the mean daily excess for these 7 days was 0·58 in., and for the 40 days ending November 11th being 0·33 in. ; from November 12th to the 14th it was below, the mean daily deficiency being 0·20 in. ; from November 15th to the 27th it was above, being particularly so from the 19th to the 24th, the mean daily excess for these 6 days being 0·69 in., and for the 13 days ending November 27th was 0·50 in. ; from November 28th to December 1st it was below, the mean daily

deficiency being 0.35 in. ; from December 2nd to the 6th it was above, the mean daily excess being 0.23 in. ; from December 7th to the 16th it was below, being as much as 0.71 in. below on the 10th, the mean daily deficiency being 0.37 in. ; from December 17th to the 26th it was above, being as much as 0.53 in., 0.61 in., and 0.52 in. in excess on December 21st, 22nd, and 23rd respectively ; the mean daily excess for the 10 days ending December 26th was 0.39 in. ; and from December 27th to the 31st it was below, being particularly so on the 30th and 31st, when it was as much as 0.78 in. and 0.76 in. respectively below, the mean daily deficiency for these 5 days being 0.45 in.

The highest reading of the barometer at the height of 159 feet above the sea was 30.570 ins. on November 21st ; and the lowest 28.820 ins. on April 1st. The yearly range was 1.750 ins.

Temperature.—The temperature of the air was generally above its average from January 1st to the 12th, the mean daily excess being 1.01 ; from January 13th to February 8th it was generally below, being particularly so on January 18th, 23rd, and 24th, the mean daily deficiency for these 3 days being 0.9 , and for the 27 days ending February 8th was 4.5 ; from February 9th to March 28th it was generally above, being particularly so on February 9th, 22nd, and 26th, and from March 19th to the 26th, the mean daily excess for these 11 days being 0.9 , and for the 48 days ending March 28th was 4.6 ; from March 29th to April 11th it was below, the mean daily deficiency being 3.8 ; from April 12th to the 18th it was generally above, the mean daily excess being 1.5 ; from April 19th to the 25th it was below, the mean daily deficiency being 2.6 ; from April 26th to May 3rd it was generally above, the mean daily excess being 2.8 ; from May 4th to the 14th it was generally below, being as much as 8.3 , 8.9 , and 9.6 below on May 11th, 12th, and 13th respectively ; the mean daily deficiency for the 11 days ending May 14th was 3.7 ; from May 15th to the 21st it was above, the mean daily excess being 3.8 ; from May 22nd to the 29th it was generally below, the mean daily deficiency being 2.3 ; from May 30th to June 6th it was generally above, the mean daily excess being 2.6 ; from June 7th to the 10th it was below, the mean daily deficiency being 5.0 ; from June 11th to the 15th it was above, being as much as 10.0 and 12.4 in excess on the 12th and 13th respectively ; the mean daily excess for the 5 days ending June 15th was 7.6 ; from June 16th to the 20th it was below, the mean daily deficiency being 4.7 ; from June 21st to August 11th it was generally above its average, being particularly so on June 23rd and 24th, and August 4th and 5th, the mean daily excess for these 4 days was 11.2 , and for the 52 days ending August 11th being 3.1 ; from August 12th to September 22nd it was generally below, being as much as 9.4 , 8.8 , and 9.1 below on September 4th, 18th, and 19th respectively ; the mean daily deficiency for the 42 days being 2.2 ; from September 23rd to the 30th it was generally above, the mean daily excess being 3.4 ; from October 1st to the 13th it was below, the mean daily deficiency being 3.3 ; from October 14th to November 30th it was generally above, being particularly so from October 15th to the 18th, and on November 13th, 14th, and 17th, the mean daily

excess for these 7 days was $10^{\circ}7$, and for the 47 days ending November 30th being $3^{\circ}2$; from December 1st to the 5th it was below, being as much as $9^{\circ}4$ below on the 4th, the mean daily deficiency being $4^{\circ}3$; from December 6th to the 20th it was generally above, being particularly so from the 14th to the 17th, the mean daily excess for these 4 days being $9^{\circ}9$, and for the 15 days ending December 20th was $4^{\circ}5$; from December 21st to the 26th it was below, the mean daily deficiency being $4^{\circ}4$; and from December 27th to the 31st the weather was mild, and the temperature greatly in excess of its average, the mean daily excess being $8^{\circ}9$.

The highest temperatures of the air were at the Royal Observatory $90^{\circ}2$, at Cambridge $89^{\circ}2$, and at Barnet $88^{\circ}4$; the lowest temperatures were at Carlisle $10^{\circ}5$, at Salisbury $13^{\circ}0$, and at Llangammarch Wells $13^{\circ}5$.

Rainfall.—The fall of rain was below its average in January, and above in both February and March; the total fall in the three months at Greenwich was 7.35 ins., or 2.43 ins. above the average. The fall of rain was below its average in each of the months of April, May, and June; the total fall in the three months at Greenwich was 4.80 ins., or 0.82 in. below the average. The fall of rain was below its average in July, and above in both August and September; the total fall in the three months at Greenwich was 6.29 ins., or 1.01 in. below the average. The fall of rain was below its average in both October and November, and above in December; the total fall in the three months at Greenwich was 3.69 ins., or 3.43 ins. below the average.

The heaviest falls of rain at our stations were at Stonyhurst 51.65 ins., at Llangammarch Wells 49.77 ins., and at Truro 46.55 ins.

The least falls of rain were at Lowestoft 20.96 ins., at Cambridge 21.23 ins., and at the Royal Observatory 22.13 ins.

The greatest number of days of rain were at Stonyhurst 210 , at Truro 204 , and at Halifax 203 .

The least number of days of rain were at Barnet 137 , at Oxford 142 , and at Whitchurch 143 .

Thunderstorms occurred on 60 days at the different stations; of these 13 were in August, 9 in June, 8 in both May and September, 7 in July, 6 in April, 4 in both March and December, and 1 in November.

Thunder was heard but lightning was not seen on 84 days; of these 16 were in August, 13 in May, 11 in June, 10 in July, 8 in September, 7 in April, 6 in October, 5 in both March and December, 2 in January, and 1 in November.

Lightning was seen but thunder was not heard on 47 days; of these 10 were in August, 7 in September, 5 in both June and December, 4 in both April and May, 3 in each of the months of January, March, and July, and 1 in each of the months of February, October, and November.

Solar halos were seen on 86 days ; of these 16 were in March, 9 in both June and August, 8 in each of the months of February, May, and October, 7 in both April and July, 5 in September, 4 in November, 3 in January, and 2 in December.

Lunar halos were seen on 58 nights ; of these 9 were in both March and October, 8 in December, 7 in February and November, 5 in May, 4 in both January and April, 3 in September, and 1 in both June and July.

Aurora borealis were seen on 2 nights, viz., once in both January and December.

Snow fell on 63 days ; of these 23 were in January, 13 in March, 7 in December, 6 in both February and April, 4 in May, 3 in November, and 1 in August.

Hail fell on 86 days ; of these 17 were in March, 12 in both April and December, 10 in both January and May, 7 in September, 5 in both July and August, 4 in February, 3 in November, and 1 in June.

Fog prevailed on 143 days ; of these 20 were in February, 19 in November, 17 in both January and October, 15 in June, 14 in December, 10 in July, 9 in September, 8 in March, 7 in April, 4 in May, and 3 in August.

* For the purposes of this table the deaths of Londoners during recent years in the Metropolitan Workhouses, Hospitals, and Lunatic Asylums situated outside Registration London, have been included, and the deaths of persons not belonging to London occurring in the London Fever Hospital, in the Middlesex County Lunatic Asylum at Wandsworth, and in the Metropolitan Asylums Board Hospitals within Registration London, have been excluded. Some of the figures for 1897 may differ, therefore, from those in Tables 11, 26, and 27.

TABLE 26.—ENGLAND.—Death-rates from several Causes in Registration Counties, 1897.

TABLE 28.—ENGLAND.—Deaths from various Causes to a Million Deaths from All Causes, 1897.

CAUSE OF DEATH.	Proportional Number.	CAUSE OF DEATH.	Proportional Number.	CAUSE OF DEATH.	Proportional Number.
ALL CAUSES	1,000,000	Inflammation of Brain or its Membranes.	13,720	Acute Nephritis	4185
Small-pox	46	Apoplexy	32,941	Bright's Disease	15,208
Chicken-pox	190	Softening of Brain	4597	Uræmia	826
Measles	23,474	Hemiplegia, Brain Paralysis.	12,067	Suppression of Urine	139
Epidemic Rose Rash	81	Paralysis Agitans	532	Calculus	135
Scarlet Fever	8,453	Insanity, General Paralysis of Insane.	6839	Hæmaturia	4312
Typhus	90	Chorea	266	Diseases of Bladder and of Prostate.	1178
Relapsing Fever	4	Epilepsy	4669	Other Diseases of Urinary System.	844
Influenza	11,243	Convulsions	33,951	Diseases of Uterus and Vagina.	1376
Whooping-cough	21,110	Laryngismus Stridulus	946	Disorders of Menstruation	137
Mumps	157	Idiopathic Tetanus	48	Pelvic Abscess	109
Diphtheria	14,135	Paraplegia, Diseases of Spinal Cord.	4074	Perineal Abscess	22
Cerebro-spinal Fever	18	Other Diseases of Nervous System.	4922	Diseases of Testes, Penis, Scrotum, &c.	150
Simple and Ill-defined Fever.	222	Otitis, Otorrhœa	1671	Abortion, Miscarriage	353
Enteric Fever	8959	Epistaxis and Diseases of Nose.	168	Puerperal Mania	137
Other Miasmatic Diseases	44	Ophthalmia and Diseases of Eye.	122	Puerperal Convulsions	580
Cholera	1758	Endocarditis, Valvular Disease.	19,657	Placenta Prævia, Flooding	1282
Diarrhœa, Dysentery	48,199	Pericarditis	1023	Phlegmasia Dolens	114
Remittent Fever	17	Hypertrophy of Heart	364	Other Accidents of Child-birth.	1993
Ague	201	Angina Pectoris	1319	Caries, Necrosis	1618
Hydrophobia	11	Syncope	2979	Arthritis, Ostitis, Periostitis	502
Glanders	11	Aneurism	1623	Other Diseases of Organs of Locomotion.	772
Anthrax, Splenic Fever	33	Senile Gangrene	2371	Carbuncle	294
Cow-pox and other effects of Vaccination.	67	Embolism, Thrombosis	2417	Phlegmon, Cellulitis	789
Syphilis	3470	Phlebitis	273	Lupus	100
Gonorrhœa, Stricture of Urethra.	700	Varicose Veins	192	Ulcer, Bed sore	1032
Phagedæna	98	Other Diseases of Circulatory System.	60,568	Eczema	689
Erysipelas	1873	Laryngitis	2371	Pemphigus	262
Pyæmia, Septicæmia	552	Croup	2030	Other Diseases of Integumentary System.	345
Puerperal Fever	3391	Other Diseases of Larynx and Trachea.	244	In Mines and Quarries	1729
Thrush	477	Emphysema, Asthma	4140	Vehicles and Horses	4890
Other Diseases from Vegetable Parasites.	28	Bronchitis	36,501	Ships, Boats, and Docks (not drowning).	489
Hydatid Disease	131	Pneumonia	64,332	Building Operations	445
Other Diseases from Animal Parasites.	90	Pleurisy	2757	Machinery	410
Starvation, Want of Breast-milk.	667	Other Diseases of Respiratory System.	7044	Weapons and Implements.	246
Scurvy	63	Stomatitis (Dis. of Mouth)	890	Burns and Scalds	4619
Intemperance { Chronic Alcoholism.	3620	Dentition	6885	Poison, Poisonous Vapours.	1276
Delirium Tremens.	807	Sore Throat, Quinsy	984	Drowning	5036
Rheumatic Fever, Rheumatism of Heart.	4667	Dyspepsia	454	Suffocation	4041
Rheumatism	1638	Hæmatemesis	545	Falls	5269
Gout	1053	Melæna	264	Weather Agencies	549
Rickets	2635	Diseases of Stomach	9269	Otherwise, or not stated	3357
Cancer	45,141	Enteritis	24,501	Homicide	539
Tabes Mesenterica	11,552	Ulceration of Intestine	622	Suicide	5156
Tubercular Meningitis (Acute Hydrocephalus).	12,200	Ileus, Obstruction of Intestine.	4115	Execution	13
Phthisis	76,903	Stricture or Strangulation of Intestine.	312	Dropsy	259
Other Forms of Tuberculosis, Scrofula.	10,043	Intussusception of Intestine.	733	Debility, Atrophy, Inanition.	37,144
Purpura, Hæmorrhagic Diathesis.	626	Hernia	2408	Mortification	70
Anæmia, Chlorosis, Leucocythæmia.	3415	Fistula	98	Tumour	223
Diabetes Mellitus	4480	Peritonitis	3647	Abscess	744
Other Constitutional Diseases.	1564	Ascites	255	Hæmorrhage	198
Premature Birth	32,834	Gallstones	826	Sudden (Cause unascertained).	377
Atelectasis	1986	Cirrhosis of Liver	7635	Other ill-defined and not specified Causes.	3557
Cyanosis	2024	Other Diseases of Liver	5799		
Spina Bifida	1215	Other Diseases of Digestive System.	984		
Imperforate Anus	336	Diseases of Spleen	135		
Cleft Palate, Hæmiplegia.	395	Diseases of Lymphatic System.	528		
Other Congenital Defects	870	Diseases of Thyroid Body	452		
Old Age	52,851	Diseases of Supra-Renal Capsules.	334		

TABLE 29.—ENGLAND. Death-rates in Town* and Country Districts, 1851-97.

YEAR.	Persons to a Square Mile in England and Wales.	ANNUAL DEATHS to 1000 Persons living in			Deaths in Town Districts to 100 Deaths in Country Districts, in equal Numbers living.

* For the years prior to 1894 the Town Districts consisted of the 33 great towns; 67 other large town districts (represented approximately by registration districts or sub-districts); and all other registration sub-districts, three-fourths of the population of which, as enumerated in 1881, resided within the boundaries of Urban Districts existing in 1886. Since the beginning of 1894 the Town Districts have consisted of the 33 great towns, 67 other large towns, and all other registration districts and sub-districts, three-fourths of the population of which, as enumerated in 1891, resided within the boundaries of Urban Districts. The Country Districts have consisted of the remainder of England and Wales.

NOTE.—Up to and including 1886 masters were excluded from the above employment and mortality figures; the latter of which contain some cases of men who died in colonial and fishing vessels not registered under the Merchant Shipping Acts, whose crews are not included in the employment column.

Since 1886 masters are included in both columns, and the employment and mortality figures relate only to persons employed in sea-going vessels (except yachts) registered under Part I. of the Merchant Shipping Act, belonging to the United Kingdom, the Isle of Man, and Channel Islands. In 1896 and 1897 the "Number of persons employed" is the sum of the number of persons engaged for the first crew of each vessel on the register on 1st January of the year and employed at sea during the preceding year.

* The prices of Consols for the years 1848-52 relate to the 12 months beginning 1st April; from 1853 onwards the prices relate to calendar years. For the years 1848-88 the prices relate to stock bearing 3 per cent. interest, for 1889-97 to stock bearing 2½ per cent.

† From the Board of Trade Statistical Abstract.

‡ The Registrar-General is unable to give precise information as to the price of meat for the years 1889-91.

§ The prices of coal are furnished by the Mineral Statistics Department of the Home Office.

¶ Derived from Returns, published by the Local Government Board, of the number of persons in receipt of Relief on the last day of each week.

INTERNATIONAL VITAL STATISTICS.

TABLE 44.—Births and Deaths per 1000 of the Population, in the UNITED KINGDOM and in OTHER EUROPEAN STATES.

(Tabulated from returns furnished by the authorities of the various States.)

NOTE.—The population in the four years 1862-65 and in the years 1867-69 is estimated by means of the average annual rate of increase observed between the two enumerations of 1861 and 1866. The deaths of Frenchmen abroad, civil or military, are registered in the books of the Commune in which they were last domiciled.

Census year.

† Cholera prevailed in 1865-66, and war raged in 1870 and 1871.

NOTE.—Statistics for the 7 years 1871-77 were not issued owing to the disturbed state of the country. The decline in registered marriages in 1870 is believed to be due to the introduction of civil registration in that year.

NOTE.—The numbers for Rome were first included with those for the Kingdom of Italy in 1872. The population figures given for census years show the numbers enumerated on 31st December in each of those years; for the end of each of the other years the population is estimated on the assumption that the rate of increase which prevailed in the last inter-censal period has since been maintained.

* The Registration Counties consist of groups of Registration Districts, each such District being generally co-extensive with the Poor Law Union of the same name. A District which extends into two or more Geographical Counties is included entirely in that Registration County in which the principal town of the District, or the greater part of the population, is located. The boundaries of the Registration Counties differ therefore more or less from the boundaries of the Geographical Counties. For areas and populations of the Registration Divisions and Counties, see pages 64 and 66.

* The Registration Districts, 635 in number at the end of the year 1897, are collections of contiguous Parishes or Places combined for purposes connected with the Registration of Births, Deaths, and Marriages, and are generally co-extensive with the Poor Law Unions of the same names; they are here arranged topographically under the Registration Counties. The Registration Sub-districts (2082 in number) are sub-divisions of Registration Districts, within which the Births and Deaths are registered by Registrars severally appointed for that purpose. The letter W denotes that the Sub-district contains within its limits a Workhouse belonging to the District or Union; w indicates a Workhouse belonging wholly or partly to other Districts than that in which it stands; H indicates a Hospital or Infirmary; L a Lunatic Asylum; and repetitions of these letters show the number of such Institutions in each Registration Sub-district.

† These areas, revised by the Ordnance Survey Department, are derived from those published in the Census Report of 1891. They do not include space occupied by foreshore or tidal water of rivers and creeks. Numerous changes in the boundaries of Districts and sub-districts have taken place since the Census of 1891; in the majority of these cases the new areas have not yet been ascertained.

‡ The population of the Registration County of London at the Census taken on 29th March 1896 was 4,411,710. The numbers enumerated in the separate sub-districts are shown in Table 5 of the Registrar General's Weekly Returns.

§ The Deaths in the principal Institutions during 1897 are given on pages 75-118.

† 10; 2, 3, 4, 5.—On 1st October 1897 the boundaries of the four Sub-districts comprising Hackney civil parish were re-arranged and re-named; 2 North Hackney, 3 Central Hackney, 4 South-West Hackney, 5 South-East Hackney. The births and deaths can only be shown for the combined sub-districts.

‡ 13; 1, 3.—On 1st November 1897 the Sub-districts of St. Andrew Eastern and St. George the Martyr were united and re-named Holborn; on 1st April 1897 the Sub-district of Pentonville was united to that of Amwell; see page 284. The births and deaths are shown as if the change had taken place at the beginning of the year.

1	Westbourne W	32040	7084	185	181	4	90	43	47	—

* 75: 3; 79: 1.—The boundaries of these sub-districts were altered on 1st July 1897: for details see page 285. The births and deaths are included in the figures for the sub-district in which they were registered.

† 76.—The District of LEWES comprises the four Poor Law Unions of Chailey (Ditchling and Chailey sub-districts), Lewes (Lewes sub-district), West Firle (West Firle sub-district), and Newhaven (Newhaven and Rottingdean sub-districts).

‡ 77: 1.—On 1st May 1897, the sub-districts of The Palace and Kemp Town were united under the name of The Pavilion; see page 285. The births and deaths are shown as if the change had taken place at the beginning of the year.

§ 83: 1, 3.—On 1st December 1897 the boundaries of these sub-districts were altered, and the sub-district of Manhood was united to that of Oving; for details see pages 285 and 286. The births and deaths are shown as if the changes had taken place at the beginning of the year.

* 101.—The District of WINCHESTER comprises the two Poor Law Unions of New Winchester (Micheldever, Winchester, and Twyford sub-districts) and Hursley (Hursley sub-district).

† 101: 1, 2.—On 1st July 1897 the sub-district of The Worthys was dissolved, and its constituent civil parishes were added to the sub-districts of Micheldever and Winchester; for details see page 286. The births and deaths are shown as if the change had taken place at the beginning of the year.

‡ 101: 4.—The boundaries of this sub-district and those of 98: 2, 3 and 99: 1 were altered during the year; for details see page 286. The births and deaths are included in the figures for the sub-districts in which they were registered.

§ 108: 1, 3.—The boundaries of these sub-districts were altered on 1st August 1897; for details see page 286. The births and deaths are shown as if the change had taken place at the beginning of the year.

* 378 : 3.—The boundaries of this sub-district and those of 341 : 2 were altered on 1st October 1897; for details see page 289. The births and deaths are included in the figures for the sub-districts in which they were registered.

† 383 : 1, 2.—On 1st October 1897 the sub-district of Claines was dissolved and its constituent parishes were added to the sub-districts of Ombersley and Droitwich; for details see page 289. The births and deaths are shown as if the change had taken place at the beginning of the year.

‡ 385 : 1, 2.—The boundaries of these sub-districts were altered on 1st January 1897; for details see page 289.

§ 385 : 3.—The boundaries of this sub-district and those of 373 : 3 were altered on 9th November 1897; for details see page 290. The births and deaths are included in the figures for the sub-districts in which they were registered.

* 421 : 2, 3.—On 1st February 1897 the sub-districts of Tattershall and Tetford were re-arranged and the old sub-district of Horncastle was dissolved, and its constituent civil parishes were added to the sub-districts of Tetford (which was renamed Horncastle) and Tattershall; for details see pages 290 and 291. The births and deaths are shown as if the changes had taken place at the beginning of the year.

† 424a ; 424b.—On 1st April 1897 the sub-district of Great Grimsby, which is co-extensive with the Poor Law Union of Grimsby, was severed from the Registration District of Caistor, and created a separate Registration District named Grimsby, and numbered 424a, the Registration District of Caistor being re-numbered 424b. The births and deaths are shown as if the change had taken place at the beginning of the year.

* 468: 6, 7; 469: 3, 4, 5.—The boundaries of these sub-districts were altered during the year; for details see page 291. The births and deaths are included in the figures for the sub-districts in which they were registered.
† 472: 1, 2.—On 1st March 1897 the sub-district of Burnley was divided into two sub-districts named (1) East Ward, (2) West Ward; for details see pages 291 and 292. The births and deaths can only be shown for the combined sub-districts.

* 507.—The District of WORTLEY comprises the two Poor Law Unions of Penistone (Cawthorne, High Hoyland, and Penistone sub-districts) and Wortley (Wortley, Ecclesfield, and Bradfield sub-districts).

† 508; 1, 2.—The boundaries of these sub-districts were altered on the 1st May 1897, and the sub-districts of Nether Hallam and Upper Hallam were re-named Hallam and Dore respectively; for details see page 292. The births and deaths are shown as if the change had taken place at the beginning of the year.

‡ 509; 5, 6.—On 1st February 1897, the sub-district of Brightside was divided into two sub-districts, viz. (5) West Brightside, and (6) East Brightside; for details see page 292. The births and deaths can only be shown for the combined sub-districts.

§ 510; 2, 3, 4.—On 1st July 1897, the sub-districts of Rotherham and Kimberworth were re-arranged and divided into three sub-districts named respectively, (2) South East Rotherham, (3) North West Rotherham, and (4) Rawmarsh. The births and deaths can only be shown for the combined sub-districts.

DEATHS IN WORKHOUSES, HOSPITALS, LUNATIC AND IDIOT ASYLUMS.

1897.

The following Table shows the numbers of deaths (Persons, Males, and Females) registered during 1897 in Workhouses, Hospitals, Lunatic Asylums, and Idiot Asylums of England. These figures afford the means of correcting the mortality of districts and sub-districts in which these Institutions are situated. The Table includes 2130 Institutions ; of these 772 are Workhouses, Workhouse Infirmaries, or Workhouse Schools ; 1244 Hospitals or Infirmaries ; and 114 Lunatic Asylums. The Lunatic Asylums comprise County and Borough Asylums, Lunatic Hospitals, and Idiot Asylums. The Hospitals and Imbecile Asylums of the Metropolitan Asylums Board are classed in the Table as Workhouses. In these 2130 Institutions 71,906 deaths were registered during the year, or 13·3 per cent. of the total deaths in England and Wales, against 12·6 and 13·0 per cent. in the two preceding years ; 40,895 occurred in Workhouses, 23,836 in Hospitals, and 7175 in Lunatic Asylums. The proportion to total deaths was 7·55 per cent. in Workhouses, 4·40 in Hospitals, and 1·33 in Lunatic Asylums. The proportion of deaths recorded in Workhouses, which had been 7·28 and 7·25 per cent. in 1895 and 1896 respectively, was 7·55 per cent. in 1897.

Information relating to the deaths recorded in many Private Lunatic Asylums, and in a few other institutions, will be found in the notes to the following pages.

Deaths in Workhouses, Hospitals, Lunatic and Idiot Asylums, 1897.

* See note page 247.

Of the above 5308 ACCIDENTS, 53 are stated to have occurred to Women in a state of INTOXICATION. In 133 other cases Death was accelerated by INTERTEMPERATE HABITS or by the supervision of DELIRIUM TREMENS, ERYSIPELAS, MORTIFICATION, PYÆMIA, or TETANUS.* Here follow the details :—

CAUSES INDUCING OR ACCELERATING DEATHS FROM ACCIDENT.		ALL AGES.	AGES AT DEATH.																	
			Total under 1 Year.		1—	2—	3—	4—	Total under 5 Years.	5—	10—	15—	20—	25—	35—	45—	55—	65—	75—	85 and up- wards.
			Infants under 1 Month.	Others.																
Intoxication at time of Accident	..	53	—	—	—	—	—	—	—	—	—	—	1	7	17	17	8	2	1	—
Acceleration by	Intemperance ..	15	—	—	—	—	—	—	—	—	—	—	—	—	4	7	4	—	—	—
	Delirium Tremens	5	—	—	—	—	—	—	—	—	—	—	—	—	1	3	1	—	—	—

INDEX OF REGISTRATION DISTRICTS.

The following Index furnishes a reference to the *Number* of each REGISTRATION DISTRICT, according to the topographical arrangement adopted in the Tables of Abstracts contained in the Report.* The alphabetical arrangement places compound names in the order in which they are pronounced: thus, East Ashford will be found under the letter E, and *not* under A.

For names of Towns such as Accrington, Jarrow, &c., which are not found in this "Index of Registration Districts," see the "Index of Registration Sub-districts" (pp. 266-276) and "Index of Urban Districts" (pp. 277-283).

A

Aberayron, 604.
Abergavenny, 582.
Aberystwith, 605.
Abingdon, 115.

In consequence of numerous alterations in districts since the numerical arrangement, 1 to 623, was adopted in the Abstracts for the year 1847, the districts were re-numbered consecutively from 1 to 630 in the Abstracts for the year 1881. Since that date five new Registration Districts have been formed, the District of Kensington having been divided into Paddington (1*a*) and Kensington (1*b*), the District of Caistor into Grimsby (424*a*) and Caistor (424*b*), the District of Bradford into Bradford (497*a*) and North Bierley (497*b*), the District of Stockton into Stockton (543*a*) and Sedgefield (543*b*), and the District of Anglesey into Anglesey (630) and Holyhead (631).

INDEX OF REGISTRATION SUB-DISTRICTS.

In this alphabetical arrangement the principle is adopted of placing the Sub-Districts (or Registrars' Districts) having *compound names* in the order indicated by the usual pronunciation of those names; thus, East Grinstead will be found under the letter E, and not as "Grinstead, East"; St. James under the letter S, and not as "James, St." The number against each Sub-District, in the third column, refers to its numerical place in the Tables of Abstracts; thus Abbey Holme (573; 2) is the 2nd Sub-District of the Wigton District.

SUB-DISTRICT.	DISTRICT.	No.	SUB-DISTRICT.	DISTRICT.	No.	SUB-DISTRICT.	DISTRICT.	No.

URBAN DISTRICTS.

Urban Districts are not in general co-extensive with Registration Areas; their exact constitution is shown in the Census Report, vol. ii., table 4.

The names of most Urban Districts are identical with those of Registration Districts or sub-districts in which they are wholly or partly situated (*see* Indexes on pages 262-276).

The following Index will facilitate reference when the name of an Urban District does not correspond with that of any Registration Area in which it, or any part of it, is situated:—

NAME OF URBAN DISTRICT.	REGISTRATION DISTRICT.	SUB-DISTRICT.	District and Sub-district Numbers.
Aberavon, M.B. ...	Neath ...	Margam ...	590 ; 1
